

## ABSTRACT

It is an object of the present invention to resolve problems resulting from removing a nut, pulling a pipe and a sleeve out from a joint main body, and then using these items to rejoin the pipe, that is, to resolve the problems of not being able to ensure airtightness or pressure resistance. The joint according to the present invention comprises a joint main body (1) having a joining hole (50) and an external threaded part (58), as well as a sleeve (3) and a nut (2). The nut (2) is screwed onto the external threaded part (58) in a state in which the pipe (10) and sleeve (3) are inserted through the joining hole (50), and is used to join the pipe (10) to the joining hole (50) via the sleeve (3). The sleeve (3) is tightly fitted to the pipe (10) and the joint main body (1) by the screwing of the nut (2), and is cut off through a linking part (32) that links a sleeve main body (31) and a separating part (33). The sleeve (3) can no longer join the pipe (10) to the joining hole (50) after the nut (2) is removed and the pipe (10) and the sleeve (3) are pulled out from the joining hole (50).
